Report Overview

Heptanoyl chloride, also known as enanthoyl chloride, is a seven-carbon fatty acid chloride with the chemical formula $C_7H_{13}ClO$. It is a clear to pale yellow liquid with a pungent odor, primarily used as an intermediate in organic synthesis, particularly in the production of pharmaceuticals, agrochemicals, and specialty chemicals. The compound reacts with alcohols and amines to form esters and amides, making it valuable in the manufacturing of active pharmaceutical ingredients (APIs), fragrances, and polymer additives. Its market is driven by demand from the pharmaceutical sector, where it serves as a key building block for drug synthesis, as well as from the agrochemical industry for pesticide formulation. However, its corrosive nature and stringent handling regulations may pose challenges to market growth. The Asia-Pacific region, particularly China and India, dominates production and consumption due to strong chemical manufacturing bases, while North America and Europe focus on high-value pharmaceutical applications.
