Abstracts

Hereditary Transthyretin Amyloidosis (HATTR) is caused by the misfolding of protein monomers derived from the tetrameric protein transthyretin (TTR). Mutations in the gene for TTR frequently result in instability of TTR and subsequent fibril formation. HATTR can be sub-classified into familial amyloid polyneuropathy (FAP) and familial amyloid cardiomyopathy (FAC). The deposition of TTR amyloid fibrils in various tissues leads to ATTR, including Familial ATTR (hereditary ATTR) and non-hereditary ATTR types. Familial ATTR is a rare disorder with unequal distribution all around the world.

The global Hereditary Transthyretin Amyloidosis (Hattr) market size was estimated at USD 1240.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
