Abstracts

Heterojunction (HJT) PECVD Machines are a type of equipment used to manufacture solar cells. PECVD stands for Plasma Enhanced Chemical Vapor Deposition (Plasma Enhanced Chemical Vapor Deposition), which is a commonly used thin film deposition technique for the production process of solar cells. Heterojunction solar cells use a heterojunction of two or more different semiconductor materials to form an efficient photoelectric conversion structure. PECVD technology is used to deposit thin films in silicon-based solar cells to enhance the performance of the cells. Specifically, PECVD machines convert gas-phase chemical precursors into solid-state materials through plasma generated by ionized gases under vacuum conditions, and form various thin films on the surface of silicon-based solar cells, such as silicon nitride films (SiN_x) and Zinc oxide film (ZnO), used to improve the light absorption, reflection and charge separation efficiency of the cell. A PECVD machine usually consists of a vacuum chamber, a gas source system, a radio frequency power supply and a control system. During operation, the precursor gas is introduced into the vacuum chamber, and under the action of the ionized gas, a plasma reaction is generated, so that the precursor is deposited on the surface of the silicon-based solar cell to form a thin film. The prices of Heterojunction (HJT) PECVD Machines products in this report are all equipment prices for the production of 1GW. In the global market, the core manufacturers of Heterojunction (HJT) PECVD Machines are mainly companies such as Shenzhen SC, Maxwell, and GS Solar.
