Report Overview

A High NA Fiber Collimator is a specialized optical device designed to efficiently couple light from a high numerical aperture (NA) fiber into a collimated beam. This product is engineered to maintain the integrity of the light's intensity and spatial distribution, ensuring minimal loss and distortion as the light transitions from the fiber to free space. The collimator is typically composed of a lens system that aligns with the fiber's core, and it operates on the principle of total internal reflection to direct the light out of the fiber in a parallel, well-defined beam. This technology is crucial in applications requiring high precision light manipulation, such as in telecommunications, biomedical imaging, and scientific research, where high NA fibers are used to transmit light with minimal divergence, and the collimator ensures that the light can be directed and focused accurately onto target surfaces or into other optical systems.
