Report Overview

Aluminum Nitride (AlN) is a covalent bond compound with hexagonal wurtzite structure. The lattice parameters are $a=3.114$, $c=4.986$. Pure aluminum nitride is bluish white, and aluminum nitride is usually gray or grayish white under normal conditions. Because of its excellent thermal conductivity, high volume resistivity, high insulation and withstand voltage, coefficient of thermal expansion, good match with silicon and other characteristics, aluminum nitride is commonly used to make ceramic electronic substrates and packaging materials, with a very broad application prospect; In addition, its excellent high temperature corrosion resistance, high temperature stability, high strength and hardness make it a potential application in high temperature structural materials. From the material point of view, aluminum nitride has higher thermal conductivity than aluminum oxide; In addition, the greatest feature of aluminum nitride is that its coefficient of thermal expansion (CTE) is equivalent to that of semiconductor silicon (Si), and its thermal conductivity is high, but its cost is high. This report studies High-purity Aluminum Nitride (AlN) Powder and Granules.
