Report Overview

High-purity Halloysite is a naturally occurring, clay-based mineral that is primarily composed of aluminum silicate hydroxide. It is characterized by its tubular structure, which endows it with unique properties such as high plasticity, excellent water absorption, and a strong affinity for organic compounds. This product is widely used in various industries due to its versatility. In ceramics and pottery, it acts as a binder and plasticizer, enhancing the workability and strength of clay bodies. In the construction industry, high-purity Halloysite is used as a pozzolan, reacting with calcium hydroxide to improve the strength and durability of concrete. It also finds applications in the paint and coating industry as a pigment and filler, providing opacity and improving the rheological properties of the paint. Additionally, its ability to absorb liquids makes it suitable for use in personal care products, such as in the formulation of creams and lotions, where it can help to bind and stabilize the product. The high purity of Halloysite ensures minimal impurities, which is crucial for applications requiring high standards of cleanliness and performance.
