Abstracts

High-purity ion-exchange membrane caustic soda is produced by electrolyzing salt water using an ion exchange membrane method. The main principle is to pass an electric current through a sodium chloride solution, and under the action of an electric field, cations in the anode chamber pass through the membrane to the cathode chamber to produce caustic soda. The cation membrane is a film made of a selectively permeable polymer material that only allows cations of a certain size to pass through.

The global High Purity Ion Membrane Caustic Soda market size was estimated at USD 4500.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
