Report Overview

The High Resolution Disc Centrifuge Particle Size Analyzer (HR-DCP) is an advanced analytical instrument designed to measure the particle size distribution of nanomaterials and colloidal suspensions with exceptional precision, typically in the range of 2 nm to 50 μ m. It operates on the principle of differential centrifugal sedimentation (DCS), where particles are separated in a spinning disc based on their size and density, allowing for high-resolution detection even for complex or polydisperse samples. This technology is particularly valued in industries requiring stringent particle characterization, such as pharmaceuticals, nanotechnology, advanced materials, and environmental science, where accurate size distribution data is critical for quality control, research, and regulatory compliance. Unlike laser diffraction or dynamic light scattering (DLS), HR-DCP offers superior resolution for dense or overlapping particle populations, making it indispensable for applications like drug delivery system optimization, semiconductor nanoparticle analysis, and polymer characterization. The instrument's ability to distinguish minor differences in particle size—often with sub-nanometer resolution—positions it as a preferred tool for advanced material science and industrial R&D.
