Abstracts

High-speed dual-channel ceramic digital isolator is an electronic device that provides electrical isolation between two circuits and allows digital signals to be transmitted through the isolation barrier. It is usually used in applications requiring high-speed communication between components with different potentials, or in noise environments where electrical noise may interfere with the accuracy of data transmission. Ceramic digital isolators use ceramic materials to create isolation barriers instead of traditional materials such as silica or air. This allows higher voltage isolation and better noise immunity. The dual-channel aspect of the device means that it has two independent channels that can transmit digital signals at the same time. This is very useful in applications such as motor control, power supply and industrial automation, because multiple signals need to be transmitted between different components.

The global High Speed Dual Channel Ceramic Digital Isolator market size was estimated at USD 350.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
