Abstracts

High-throughput screening (HTS) assay is a method used in drug discovery and other fields to quickly and efficiently test a large number of compounds or samples for a specific biological activity. HTS assays are typically automated and can screen thousands to millions of compounds in a relatively short amount of time. HTS assays are often used in the early stages of drug discovery to identify potential lead compounds that show promising activity against a target of interest. These assays can be used to screen for a wide range of biological activities, such as enzyme inhibition, receptor binding, or cell-based assays. There are several different types of HTS assays, including biochemical assays, cell-based assays, and phenotypic assays. Biochemical assays measure the activity of a specific enzyme or protein, while cell-based assays use living cells to measure the effect of compounds on cellular processes. Phenotypic assays measure a specific observable phenotype, such as cell growth or morphology. Overall, HTS assays are a powerful tool in drug discovery and other fields, allowing researchers to quickly and efficiently screen large libraries of compounds to identify potential drug candidates.

The global High Throughput Screening Hts Assay market size was estimated at USD 4326.85 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.45% during the forecast period.
