### Report Overview

The HIV Prevention Drug, also known as Pre-Exposure Prophylaxis (PrEP), is a medication prescribed to individuals who are at high risk of contracting HIV but are not yet infected. This drug, when taken consistently, significantly reduces the likelihood of HIV transmission through sexual contact or intravenous drug use. The most common form of PrEP is a combination of emtricitabine and tenofovir disoproxil fumarate, which are antiretroviral drugs that work by inhibiting the activity of the HIV virus, thus preventing it from establishing a new infection. PrEP is a crucial tool in HIV prevention strategies, complementing other measures such as condom use and regular testing. It is important to note that PrEP is not a cure for HIV, and individuals taking it must continue to practice safe sex and undergo regular HIV testing to ensure its effectiveness and monitor their health status.
