Report Overview

A hollow fiber hemodialyzer is a medical device used in hemodialysis, a therapy for patients with kidney failure. It consists of numerous small hollow fibers that act as semi-permeable membranes to filter waste products and excess fluid from the blood while retaining essential components. The hollow fiber hemodialyzer is typically connected to a blood pump and control system. During hemodialysis, the patient's blood passes through the hollow fiber hemodialyzer's fiber pathways instead of the natural kidneys. Inside the dialyzer, the semi-permeable membranes of the fibers separate waste, toxins, and excess water from the blood, which are then eliminated through dialysate. At the same time, the dialyzer retains nutrients and other important substances in the blood to maintain balance in the body.
