Report Overview

Hollow Fiber Tangential Flow Filtration (TFF) Modules are advanced filtration systems designed for the separation and purification of biological molecules, such as proteins, viruses, and cells, in various industries like pharmaceuticals, biotechnology, and diagnostics. These modules utilize a bundle of hollow fiber membranes, which are made of materials like polysulfone or polyethersulfone, to provide high surface area for efficient separation. The tangential flow design allows the feed solution to flow parallel to the membrane surface, promoting the continuous removal of retained solutes while the permeate passes through the membrane. This process helps in concentrating and purifying target molecules, reducing the risk of fouling, and maintaining high flow rates. Hollow Fiber TFF Modules are known for their scalability, ease of operation, and ability to handle large volumes, making them a preferred choice for downstream processing in biopharmaceutical applications.
