### Report Overview

Hollow microneedles are innovative microscale structures designed for the purpose of transdermal drug delivery and other biomedical applications. These microneedles are characterized by their hollow, cylindrical shape, which allows for the infusion of substances directly into the skin without the need for painful injections. They are typically made from biodegradable or biocompatible materials such as silicon, metal, or polymers. The hollow structure enables the microneedles to penetrate the skin's outer layer (stratum corneum) and reach the deeper layers where they can release the encapsulated drug or vaccine. This technology offers several advantages, including reduced pain, minimal skin damage, and the potential for precise control over drug release rates. Hollow microneedles are being researched and developed for a variety of applications, including vaccination, treatment of skin conditions, and cosmetic procedures, due to their potential to improve patient compliance and therapeutic outcomes.
