Abstracts

The Horizontal Double Break Disconnecter rotating isolating switch has the advantages of fewer movable joints, simple structure, and low operating force. However, when disconnected, the conductive movable part rotates 90 degrees along with it, increasing the interphase distance of the isolating switch and thus enlarging the clearance width of the distribution device. For example, the clearance width in the distribution device using a 252 kV double-column horizontal rotating isolating switch is 14 meters, while other types only require 13 meters. Nevertheless, due to its simple operation of rotating the insulating support column with only one disconnecting point, it ensures reliable and safe operation, making it superior to other types of isolating switches.

The global Horizontal Double Break Disconnecter market size was estimated at USD 1250.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
