Abstracts

The Horizontal Stabilizer Trim Actuator is a device that is used to adjust the pitch of an aircraft during flight. It is typically located on the horizontal stabilizer of the aircraft and is designed to make small adjustments to the aircraft's angle of attack or pitch. The Horizontal Stabilizer Trim Actuator consists of an electric or hydraulic system that controls the stabilizer's angle and position. The primary purpose of the Horizontal Stabilizer Trim Actuator is to provide stability to the aircraft in flight, by allowing the pilot to make small adjustments to the aircraft's angle of attack. This adjustment is critical for maintaining the aircraft's level of flight, and any changes in altitude. The actuator is either controlled manually by the pilot or through an automatic flight control system. The Horizontal Stabilizer Trim Actuator works by changing the angle of the aircraft's horizontal stabilizer. The stabilizer's angle can be adjusted by moving a small trim tab located on the trailing edge of the stabilizer using an electric or hydraulic control system. The trim tab is connected to the actuator, which moves it up or down to adjust the angle of the horizontal stabilizer. The Horizontal Stabilizer Trim Actuator is a critical component of the aircraft's flight control system, and its proper functioning is essential for the safe operation of the aircraft.

The global Horizontal Stabilizer Trim Actuator market size was estimated at USD 285.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
