Report Overview

Hot rolled coil (HRC) steel is a flat steel product manufactured by heating slabs above their recrystallization temperature and passing them through a series of rollers to achieve the desired thickness, typically ranging from 1.5 mm to 25 mm. The process results in a malleable, ductile, and cost-effective material with a rough surface finish, making it suitable for further processing in industries such as automotive, construction, machinery, and pipe manufacturing. Unlike cold rolled steel, HRC retains scale and requires additional treatments like pickling or galvanizing for corrosion resistance. Its primary advantages include high formability, strength, and affordability, though it lacks the precise dimensional tolerances and smooth finish of cold-rolled alternatives. The market for HRC is highly cyclical, influenced by raw material costs (primarily iron ore and coking coal), global steel demand, trade policies, and infrastructure investments, with China, the EU, and the US being key production and consumption hubs.
