Report Overview

Hot Rolled Silicon Steel Plate is a type of electrical steel that is widely used in the manufacturing of transformers, electric motors, and generators due to its high magnetic permeability and low core loss. This product is made by rolling silicon steel sheets at high temperatures, which results in a material with a relatively rough surface finish compared to cold-rolled counterparts. The addition of silicon, typically around 2-5%, enhances the steel's magnetic properties, making it ideal for applications where efficient energy transformation is critical. Hot Rolled Silicon Steel Plate is characterized by its ability to withstand high magnetic flux densities and its resistance to hysteresis losses, which are energy losses that occur as a result of the material's magnetic properties. This product is essential in the electrical industry for its role in improving the efficiency and performance of various electrical devices.
