Report Overview

The Human Body Infrared Sensor Module is a technological device designed to detect the presence of humans by sensing the infrared radiation emitted by their bodies. This module typically consists of a sensitive infrared sensor that can pick up the heat signature unique to humans, allowing it to differentiate between humans and other objects or animals. It operates by measuring the infrared energy emitted by a person's body, which is usually at a different temperature than the surrounding environment. The sensor module can be integrated into various applications such as security systems, lighting controls, and motion detection devices. It is often used in smart home systems to automate lighting and heating based on human presence, enhancing energy efficiency and user convenience. The module's functionality is based on the principle that humans emit infrared radiation, which can be detected and processed by the sensor to trigger specific actions or responses in the connected system.
