Report Overview

Human Cytomegalovirus (HCMV) Envelope Glycoprotein B (gB) is a critical viral surface protein essential for host cell entry, mediating fusion between the viral envelope and host cell membranes. It is a major target for neutralizing antibodies and a key antigen in vaccine development, given its role in viral infectivity and immune response modulation. The market for HCMV gB is primarily driven by its applications in diagnostics, therapeutics, and vaccine research, particularly in addressing congenital CMV infections and immunocompromised patients. Growing awareness of HCMV-related complications, coupled with advancements in recombinant protein technologies and immunogenicity studies, is fueling demand. However, challenges such as complex protein expression, regulatory hurdles, and high R&D costs may hinder market growth. Key players include biopharmaceutical companies and research institutions focusing on antiviral therapies and prophylactic vaccines. The market is expected to expand with increased funding for infectious disease research and the rising prevalence of HCMV infections globally.
