Report Overview

Human Defensin is a family of antimicrobial peptides that are crucial components of the innate immune system in humans. These peptides are small proteins that are expressed by various cells, including neutrophils and epithelial cells, and play a vital role in defending the body against a wide range of pathogens, such as bacteria, fungi, and viruses. Human Defensins are characterized by their cysteine-rich structure, which allows them to form stable beta-sheet structures that facilitate their interaction with microbial membranes, leading to membrane disruption and ultimately, the killing of the pathogen. They also contribute to immune modulation by promoting chemotaxis and the activation of other immune cells. The human defensin family is divided into two major groups: alpha-defensins (HNP1-4) and beta-defensins (hBD1-4), each with distinct properties and functions.
