Report Overview

Integrin Beta 3, also known as CD61, is a protein that plays a crucial role in cell adhesion, migration, and signal transduction in humans. It is a subunit of the integrin family, which consists of heterodimeric transmembrane receptors composed of an alpha and a beta subunit. Integrin Beta 3 specifically pairs with Integrin Alpha IIb to form the integrin heterodimer known as $\alpha\text{IIb}\beta_3$, which is predominantly expressed on the surface of platelets and megakaryocytes. This integrin is essential for platelet aggregation and clot formation, as it binds to fibrinogen and other extracellular matrix proteins, facilitating the blood clotting process. In addition to its role in hemostasis, Integrin Beta 3 is also involved in various cellular processes, including cell migration, angiogenesis, and immune responses. Understanding the structure, function, and regulation of Integrin Beta 3 is vital for developing therapeutic strategies for conditions such as thrombosis, inflammation, and cancer.
