Report Overview

A human skin equivalent, often referred to as a skin substitute or artificial skin, is a laboratory-created material designed to mimic the structure and function of human skin. These substitutes are used for various purposes, including medical research, drug testing, and wound care. Human skin equivalents typically consist of layers that simulate the epidermis, dermis, and sometimes the hypodermis, replicating the complex structure of natural skin. They may include synthetic or biological materials, and some are even engineered using cells derived from human or animal sources. The primary goal is to create a model that closely resembles human skin, allowing researchers to study skin physiology, test the effects of drugs or cosmetics, and develop therapeutic interventions for skin-related conditions. Additionally, human skin equivalents play a crucial role in reducing the reliance on animal testing in various scientific and medical applications.
