Abstracts

Hydrated salt phase change materials, as a type of inorganic phase change materials, mainly refer to inorganic salts containing crystalline water. These salts lose crystalline water when heated, changing from solid to liquid or gaseous state, and absorb a large amount of heat energy in the process; when the temperature drops, they reabsorb crystalline water, change from liquid or gaseous state back to solid state, and release the previously stored heat energy. This phase change process is accompanied by the storage and release of energy, which makes hydrated salt phase change materials have a wide range of application potential in the fields of thermal energy storage, temperature regulation, etc.

The global Hydrated Salt Phase Change Material market size was estimated at USD 285.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
