### Report Overview

A hydraulic actuated butterfly valve is a type of quarter-turn rotary valve that is operated by a hydraulic actuator. It is designed to control the flow of various fluids, such as water, oil, and gases, by rotating a disc or butterfly-shaped element around its axis. The valve consists of a circular plate or disc with a hole in the center, which is attached to a shaft that passes through the valve body. When the actuator applies pressure, it rotates the disc to open or close the valve, thereby controlling the flow of fluid. This type of valve is known for its quick operation, low pressure drop, and compact design, making it suitable for a wide range of industrial applications, including water treatment, chemical processing, and power generation. The hydraulic actuation system allows for precise control and can be easily integrated into automated systems, providing reliable and efficient flow control.
