Report Overview

Hydrocortisone cream is a topical corticosteroid medication primarily used to reduce inflammation, itching, and irritation caused by various skin conditions such as eczema, dermatitis, allergic reactions, and insect bites. Its active ingredient, hydrocortisone, mimics the effects of cortisol, a natural hormone produced by the adrenal glands, to suppress immune responses and alleviate symptoms. Available in varying strengths (typically 0.5% to 2.5% for over-the-counter formulations and higher concentrations by prescription), it is widely accessible in pharmacies, supermarkets, and online retailers. The product is favored for its rapid relief and effectiveness in treating mild to moderate skin conditions, though prolonged use can lead to side effects like skin thinning or discoloration. Its broad application and non-prescription availability in lower doses contribute to its steady demand in both consumer and healthcare markets.
