Abstracts

Hydrocracking Pretreatment Catalysts are specialized materials used in the refining process to prepare feedstocks for hydrocracking. Their primary function is to remove impurities such as sulfur, nitrogen, and metals from the raw feed, which would otherwise deactivate the hydrocracking catalysts and hinder efficiency. These catalysts, typically composed of metals like nickel, cobalt, molybdenum, or tungsten supported on alumina or other porous materials, enable hydrotreating reactions under high pressure and temperature in the presence of hydrogen. This pretreatment improves the feedstock's quality, enhancing the overall performance of the hydrocracking process.

The global Hydrocracking Pretreatment Catalysts market size was estimated at USD 1180.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
