Report Overview

Hydroelectric turbines, also known as water turbines, are mechanical devices used in hydroelectric power plants to convert the kinetic energy of flowing water into mechanical energy, which is then transformed into electricity. These turbines are designed to harness the potential energy of water, typically from rivers, dams, or reservoirs, by utilizing the force of water flow to rotate the turbine blades. The rotation of the blades drives a generator, which produces electricity. Hydroelectric turbines come in various types, including Francis, Kaplan, and Pelton turbines, each designed to operate under different water flow conditions and head pressures. They play a crucial role in sustainable energy production, as hydroelectric power is a clean, renewable energy source that contributes to reducing greenhouse gas emissions and reliance on fossil fuels.
