Report Overview

Hydrogel-coated coils are a type of medical device used in interventional radiology and neurosurgery, primarily for the treatment of cerebral aneurysms. These coils are made of a platinum-based alloy and are coated with a hydrogel layer, which is a network of cross-linked polymer chains that can absorb and retain water. The hydrogel coating serves to enhance the biocompatibility of the coils, reducing the risk of inflammation and promoting healing. When deployed within an aneurysm, the hydrogel-coated coils help to fill the aneurysm sac, promoting thrombosis and preventing the rupture of the aneurysm by excluding it from the circulation. The hydrogel layer also allows for better conformability to the aneurysm's shape, ensuring a more secure and effective embolization.
