Report Overview

Hydrogen-based synthetic fuel, also known as e-fuels or power-to-liquid (PtL), is a type of renewable energy source that is produced through a process of combining hydrogen with carbon dioxide (CO₂) to create synthetic hydrocarbon fuels. These fuels are derived from water and carbon dioxide, using renewable energy sources such as wind, solar, or hydroelectric power to generate the necessary hydrogen through electrolysis. The resulting synthetic fuel can be used in various applications, including transportation, power generation, and industrial processes, offering a carbon-neutral alternative to traditional fossil fuels. This innovative technology has the potential to significantly reduce greenhouse gas emissions and contribute to the global transition towards a more sustainable energy future.
