Report Overview

A Hydrogen Fuel Cell Membrane Electrode Assembly (MEA) is a critical component of a proton exchange membrane fuel cell (PEMFC) system. It consists of a proton-conducting polymer electrolyte membrane, typically made of perfluorosulfonic acid (PFSA), sandwiched between two electrodes: a cathode and an anode. The anode is coated with a catalyst, often platinum, to facilitate the oxidation of hydrogen gas, while the cathode, also coated with a catalyst, aids in the reduction of oxygen. The MEA is designed to enable the efficient transfer of protons from the anode to the cathode through the electrolyte membrane, while also allowing the passage of electrons through an external circuit, generating electrical power. The overall function of the MEA is to convert chemical energy from hydrogen and oxygen into electrical energy, with water and heat as byproducts, making it an environmentally friendly energy conversion technology.
