Report Overview

A Hydrogen Fuelled Gas Turbine is a type of power generation system that utilizes hydrogen as its primary fuel source. This advanced technology combines the principles of gas turbines, which are rotary engines that generate electricity by expanding gas, with the use of hydrogen as a clean and efficient fuel. In this system, hydrogen is combusted within the turbine's combustion chamber, producing high-pressure, high-temperature gas that drives the turbine's blades, which in turn spins a generator to produce electricity. The use of hydrogen as fuel offers significant environmental benefits, as it produces only water vapor as a byproduct, resulting in zero greenhouse gas emissions. This technology is considered a key component in the transition towards a more sustainable and carbon-neutral energy infrastructure, particularly as it can be integrated with renewable energy sources to store and utilize excess energy in the form of hydrogen.
