Report Overview

The hydrogen internal combustion engine vehicle (H2ICE) is a type of alternative fuel vehicle that utilizes hydrogen gas as its primary fuel source in a modified internal combustion engine (ICE), similar to conventional gasoline or diesel engines but with adaptations to accommodate hydrogen's combustion properties. Unlike hydrogen fuel cell vehicles (FCEVs), which generate electricity through a chemical reaction to power an electric motor, H2ICEs burn hydrogen directly in the engine, producing water vapor as the primary emission and significantly reducing greenhouse gases compared to fossil fuel-powered engines. While H2ICEs benefit from existing ICE manufacturing infrastructure and offer a transitional solution toward zero-emission mobility, they face challenges such as lower efficiency compared to FCEVs, limited hydrogen refueling infrastructure, and competition from battery electric vehicles (BEVs) and FCEVs in the clean transportation sector. The market for H2ICEs remains niche, primarily explored in heavy-duty and off-road applications where battery electrification is less feasible, but advancements in hydrogen storage, engine efficiency, and policy support could influence its future adoption.
