Report Overview

Hydrotalcite and Hydrotalcite-Like Compounds (HTLCs) are a class of anionic clay minerals and synthetic layered double hydroxides (LDHs) that possess unique properties and applications. These compounds are characterized by their layered structure, where positively charged metal hydroxide layers are balanced by interlayer anions and water molecules. The general formula for hydrotalcite is $[M_{2+}^{1-x}M_{3+}^x(OH)_2]_x[An^-]_{x/n}mH_2O$, where M_{2+} and M_{3+} represent divalent and trivalent metal cations, respectively, An^- represents an anion, and x is the ratio of M_{3+} to the total metal cations. HTLCs exhibit high anion exchange capacity, making them useful in various applications such as catalysts, adsorbents, drug delivery systems, and flame retardants. Their versatility stems from the ability to tailor their composition, structure, and properties by altering the metal cations, anions, and synthesis conditions. This customization allows for targeted applications in diverse fields, including environmental remediation, chemical processing, and pharmaceuticals.
