Report Overview

A hypothermia blanket is a medical device used to lower a patient's internal body temperature. The blanket can be used to lower the temperature of a patient with an elevated body temperature, or it can be used on a patient with a normal temperature to prevent further damage during a medical crisis. Cold water circulates within the sealed blanket to both absorb excess heat and to provide a cooling mechanism for the body. The blankets are used with specific criteria regarding the temperature goal to be reached and how long the patient is to be kept at the target temperature. Hypothermia can be a dangerous medical condition, and these cooling blankets should only be used under medical supervision.
