### Report Overview

A Hyperthermia-Hypothermia Blanket is a medical device designed to regulate and maintain a patient's body temperature during various medical procedures, surgeries, or in critical care settings. This blanket works by circulating a temperature-controlled fluid through a series of tubes embedded within the fabric, allowing for precise temperature control. It can be used to induce hyperthermia (elevated body temperature) for therapeutic purposes, such as in cancer treatment, or hypothermia (reduced body temperature) to protect the brain and other organs during surgeries or in cases of traumatic injury. The blanket is typically connected to a temperature control unit that monitors and adjusts the fluid temperature based on the patient's needs, ensuring optimal temperature management for the specific clinical application.
