Abstracts

IC programming service refers to a technical service that uses special equipment and software to write specific programs or data into the internal storage unit of an integrated circuit (IC) chip. This service is widely used in various programmable devices, such as microcontrollers (MCU), memories (Flash, EEPROM), programmable logic devices (CPLD/FPGA), etc., and is designed to achieve functional customization and control logic configuration of electronic products. IC programming services usually include burning, verification, encryption, batch copying and other links, which are common in electronic product manufacturing, R&D debugging, sample verification and mass production stages, and are one of the key steps in the development and production of electronic hardware. The development trend of IC programming services is moving towards higher efficiency, automation and intelligence. With the rapid development of the electronics manufacturing industry, the requirements for programming speed and accuracy are increasing, prompting programming equipment to develop in the direction of high speed and high throughput. At the same time, the advancement of automation technology has made unattended batch programming possible, greatly improving production efficiency and reducing labor costs. In addition, with the popularization of emerging technologies such as the Internet of Things (IoT) and 5G communications, the application scenarios of programmable devices have become more extensive, driving the growth of customized programming demand. In terms of security, protecting intellectual property rights and preventing illegal copying have also become important considerations in programming services, and encryption technology and secure burning solutions have therefore received more attention and development.

The global IC Programming Service market size was estimated at USD 1528.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.
