### Report Overview

An IC tray, also known as an integrated circuit tray or chip tray, is a specialized component carrier designed for the safe storage, handling, and transportation of semiconductor components such as microchips, ICs, and other delicate electronic devices. These trays are typically made from high-performance engineering plastics such as polycarbonate, PPS, or PEEK, and are often ESD-safe (electrostatic discharge resistant) to protect sensitive devices from static damage. They are engineered to meet JEDEC standards to ensure compatibility with automated manufacturing and assembly equipment. IC trays are crucial in the semiconductor supply chain as they help minimize mechanical and electrostatic damage during logistics, facilitate high-speed pick-and-place operations in SMT (surface mount technology) lines, and optimize storage in cleanroom environments.

In 2023, the global IC tray market was estimated to be valued at approximately USD 325 million, driven by the consistent growth of semiconductor demand across consumer electronics, automotive electronics, and industrial applications. Looking forward, the market is expected to grow at a compound annual growth rate (CAGR) of around 4.9% from 2024 to 2033, reaching a projected market size of approximately USD 1.63 billion by 2033. This sustained growth is underpinned by several key drivers. Firstly, the increasing complexity and miniaturization of semiconductor devices have necessitated the use of highly engineered packaging and handling solutions. Secondly, the rise of 5G, AI chips, and IoT technologies has led to an expanding variety of IC designs, which in turn demand customized and protective packaging like IC trays. In addition, the globalization of the semiconductor supply chain and the rising automation in chip manufacturing and assembly facilities have further increased the need for standardized

and reliable IC handling solutions.
