Report Overview

ICL, or Intraocular Lens, is a medical device used in ophthalmology to correct vision impairments such as myopia, hyperopia, and astigmatism. It is a small, flexible, and foldable lens that is implanted within the eye, typically in the anterior chamber, to replace the natural lens or to augment its focusing capabilities. The ICL is designed to provide a permanent solution for individuals who are not suitable candidates for laser eye surgery or who prefer a non-laser alternative. The lens is custom-made for each patient, ensuring optimal fit and vision correction. It offers several advantages, including the preservation of corneal tissue, the potential for reversibility, and the ability to correct a wide range of refractive errors. The ICL is a popular choice for those seeking a minimally invasive approach to vision correction, providing a high level of precision and predictability in the outcome.
