Report Overview

Icosapent ethyl soft capsules are a prescription medication derived from omega-3 fatty acids, specifically eicosapentaenoic acid (EPA), and are primarily used to reduce cardiovascular risk in adults with elevated triglyceride levels. These capsules function by lowering triglyceride production in the liver and are often prescribed alongside statins for patients with persistent high triglycerides despite lipid-modifying therapy. The drug is particularly significant for individuals with established cardiovascular disease or diabetes, as it has demonstrated efficacy in reducing major adverse cardiovascular events, including heart attacks and strokes. Marketed under brand names such as Vascepa, icosapent ethyl has gained regulatory approvals in key regions like the U.S. and Europe, positioning it as a critical treatment in the cardiovascular therapeutics segment. The growing prevalence of hypertriglyceridemia and related metabolic disorders, coupled with increasing awareness of cardiovascular risk management, drives demand for this specialized therapy, making it a notable player in the lipid-lowering drug market.
