### Report Overview

The ICP-MS interface cone is a critical component in inductively coupled plasma mass spectrometry (ICP-MS) systems, serving as the connection point between the plasma torch and the mass spectrometer. It consists of two primary parts: the sampler cone, which extracts ions from the plasma, and the skimmer cone, which further focuses the ion beam into the mass spectrometer. These cones are typically made from high-purity nickel or platinum to withstand extreme temperatures and corrosive plasma conditions while maintaining precise ion transmission. The performance of the interface cone directly impacts sensitivity, detection limits, and signal stability, making it a key factor in analytical accuracy for applications such as environmental testing, pharmaceutical analysis, and materials science. Given its role in facilitating the transition from atmospheric-pressure plasma to high-vacuum mass spectrometry, the design and material durability of the cone are crucial for minimizing signal noise and maximizing instrument longevity.
