### Report Overview

IGY Polyclonal Antibodies are a type of immunoglobulin derived from the yolks of immunized hens' eggs. These antibodies are produced in response to the introduction of specific antigens into the hen, which stimulates the hen's immune system to generate antibodies. IGY (Immunoglobulin Y) antibodies are unique to birds and are analogous to mammalian IgG antibodies. They are known for their high stability, resistance to heat and proteolytic degradation, and their ability to recognize and bind to a wide range of antigens. IGY Polyclonal Antibodies are used in various applications, including diagnostic tests, research, and therapeutics, due to their versatility and the ease of egg collection as a source of antibodies. They offer a cost-effective and ethical alternative to traditional mammalian-derived antibodies, especially in cases where the target antigen is toxic or difficult to handle.
