Report Overview

An immunoturbidity kit is a kit used to determine the concentration of a specific substance in blood or other biological samples. It is based on the immunoturbidity, which combines specific antibodies with the substance to be tested to form immune complexes, resulting in an increase in turbidity of the solution. In order to determine the concentration of a substance to be measured, it is usually necessary to compare it with a standard of known concentration. Standards are substances of known concentration that bind to the antibodies in the kit to form immune complexes that produce a specific turbidity. By comparing the turbidity of the sample to be measured with that of a standard, the concentration of the substance to be measured can be inferred.
