Report Overview

An In-Circuit Test (ICT) System for Printed Circuit Boards (PCB) is a sophisticated testing equipment designed to verify the functionality and integrity of electronic circuits embedded within PCBs. It performs a series of tests on the PCB while it is still in the development or manufacturing stage, ensuring that all components and connections meet the required specifications. The ICT system works by sending a series of electronic signals through the PCB, checking for continuity, resistance, and voltage levels at various points. This process helps identify any defects, such as open circuits, short circuits, or incorrect component values, which could lead to malfunctions in the final product. The system is crucial for quality control in electronics manufacturing, as it can significantly reduce the number of faulty boards reaching the end consumer, thereby improving product reliability and reducing costs associated with rework and returns.
