Report Overview

In-the-Canal (ITC) hearing aids are a type of hearing device designed to be custom-molded and worn within the ear canal, providing a discreet and comfortable solution for individuals with mild to moderately severe hearing loss. These devices are smaller than Behind-the-Ear (BTE) hearing aids and are placed deeper into the ear, making them less visible. ITC hearing aids consist of a small case that houses the electronic components, such as the microphone, amplifier, and speaker, which are designed to fit snugly within the ear canal. They are connected to a small custom-made shell that fits into the outer part of the ear, known as the concha. The primary function of ITC hearing aids is to amplify sounds, particularly speech, to help users better understand conversations and environmental noises. These aids are known for their natural sound quality and ability to minimize feedback, making them a popular choice for those seeking a less conspicuous hearing solution.
