Report Overview

Indium Gallium Zinc Oxide Display (IGZO) is a type of advanced thin-film transistor (TFT) technology used in the manufacturing of liquid crystal displays (LCDs) and organic light-emitting diode (OLED) displays. IGZO is a compound semiconductor material composed of indium, gallium, and zinc, combined with oxygen. This material offers several advantages over traditional amorphous silicon (a-Si) TFTs, such as higher electron mobility, lower power consumption, and the ability to be manufactured on larger glass substrates. As a result, IGZO displays can deliver higher resolution, better image quality, and more energy-efficient performance compared to conventional LCDs. The technology is particularly useful in applications requiring high-definition displays, such as smartphones, tablets, and high-resolution monitors, due to its ability to support more pixels per inch and reduce the overall power consumption of the device.
