Abstracts

The inductive angular velocity transducer is a device used to sense and maintain the direction. It is designed based on the theory that angular momentum is immortal. Applying the principle of Coriolis force, once the gyroscope starts to rotate, the gyroscope has a tendency to resist the change of direction due to the angular momentum of the wheel. The built-in special ceramic device greatly simplifies the device structure and circuit device, so that it has superior operating characteristics. Mainly used in car navigation, position control and attitude control of moving objects, and other occasions that require accurate angle measurement.

The global Inductive Angular Velocity Transducers market size was estimated at USD 42.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
