Report Overview

An Inductive Loop Detector is a type of traffic sensor that uses electromagnetic induction to detect and monitor vehicles on a road. It consists of a loop of wire embedded in the pavement, which creates an electromagnetic field when a current is passed through it. When a vehicle passes over the loop, it disturbs the field, causing a change in the current that can be detected by a nearby control unit. This technology is widely used in traffic management systems for applications such as traffic signal control, vehicle counting, and speed detection. The inductive loop detector is known for its reliability, durability, and ability to operate in various weather conditions, making it a robust solution for real-time traffic data collection and management.
