Report Overview

An Inductive Positioning System (IPS) is a technology that utilizes electromagnetic fields to accurately determine the position of a device or object within a defined area. This system typically consists of a transmitter that generates a magnetic field and a receiver that detects the field's strength and phase. By analyzing the variations in the magnetic field, the IPS can calculate the precise location and orientation of the receiver. It is widely used in various applications, such as industrial automation, robotics, and medical equipment, where high precision and reliability are crucial. The system offers advantages like real-time tracking, resistance to interference, and the ability to work in harsh environments, making it a robust solution for precise positioning needs.
