Abstracts

A heat exchanger transfers heat from one medium to another. It can be a solution for recovering or salvaging that wasted heat in the waste gases and improving efficiencies. Some may refer to it as a heat recovery or gas cooling technology. Hot exhaust air from a process can represent valuable energy that could be recovered and used to reduce your utility bills. Often, the process exhaust gas temperature may need to be decreased or increased to properly match the requirements of downstream air pollution control equipment. For instance, gas leaving an oven at 200°F would have to be reduced to about 100°F to be treated by some forms of adsorption or to be treated by most biological systems.
